

ASSIGNMENT ON MATHEMATICS

Session: 2026 | Subject: Mathematics | Class: VIII

Chapter II. Percentage:

- (i) If the bamboo is 2 metres long and of which 38 cm is coloured with yellow, then what is the percentage of yellow colour in relation to the whole length of the bamboo?
- (ii) A train will go to Burdwan from Howrah station. The distance of chord line between Burdwan and Howrah is 85 km. But the distance in the main line is 5% more than chord line. Let's calculate the distance between Howrah and Burdwan in the main line by the method of proportion.
- (iii) The income of Amina Bibi was increased by 20% and later decreased by 20%. Let's work out the total change of percentage of her income.
- (iv) The length of a rectangle is increased by 15% and the breadth is reduced by 15%. Let's work out in percentage the increase or decrease of area.
- (v) In a legislative election, 80% voters cast their votes and the winning candidate got 65% of the cast votes. Let's work out the percentage of total voters who supported him.
- (vi) The price of sugar has increased by 20%. Let's work out the percentage of decrease in consumption of sugar if the monthly expenses of sugar remain same.
- (vii) The length of each arm of a square was increased by 10%. Let's work out the increase of percentage of area by the Rule of Three.
- (viii) Uma Devi of Pahalampur has used high-yielding seeds in her fields. As a result, the production of paddy has increased by 20%, but the cost of production of paddy has increased by 25%. Earlier she used to get the production worth Rs. 1560 by spending Rs. 600. Let's work out how much she will earn more now using high-yielding seeds.
- (ix) Niyamat uncle of Faridpur has used high-yielding paddy seed in his field. For this the production of paddy has increased by 35% but the cost of cultivation has increased by 35%. Let's work out the present profit of Niyamat uncle in comparison with the previous return of Rs. 1220 by investing Rs. 450 in the same field.
- (x) Trisha has bought a book from the book stall of Milan dada. Milandada gave her discounts of 10% and 5% respectively. Let's work out how much Trisha paid to Milandada if the M.R.P of the book was Rs. 200.

Chapter 17. Time and Work:

- (i) In Piyali's tank, the empty tank is filled with the first pipe in 40 minutes and the full tank is made empty with another pipe in 60 minutes. Piyali opened the two pipes together. Let's calculate the time to fill the empty tank.
- (ii) Abani and Anwar complete a work separately in 20 and 25 days respectively. After 10 days of their working together, they both left then Sukhen came and completed the remaining work in 3 days. If Sukhen alone would do the work, let's calculate how many days he would take to complete the work.
- (iii) Rehana's tank can be filled up in 30 minutes by the municipality water supply pipe. Opening all the taps for three hours they can use water for 4 hours with the water of the full tank. One day the water supply pipe remains open for 25 minutes, let's calculate how long they will work with that water.
- (iv) Ruma and Rohit can complete a work in 20 days, Rohit and Sobha can complete that work in 15 days, and Ruma and Sobha can complete it in 20 days. Let's calculate in how many days they will complete the work together. Also, calculate in how many days each of them can complete the work individually.
- (v) Alok, Kalam and Joseph individually can complete a work in 10, 12 and 15 days respectively. They started doing the work together. After 3 days Kalam had to go. Let's make proportion and calculate in how many days Alok and Joseph will complete the remaining work.
- (vi) Mary and David can do a work individually in 10 days and 15 days respectively. At first Mary alone worked for 4 days, then David alone worked for 5 days and left. Maria came and completed the remaining work in 4 days. If Mary, David and Maria would work together, let's calculate in how many days they would complete the work.
- (vii) A municipality made a tank for water preservation and added pumps with it. The pumps separately can fill the empty tank in 16, 20 & 30 hours respectively. Today when the 3 pumps started together at 7:00 AM, $\frac{1}{3}$ part of the tank was filled with water. After 1 hour 36 minutes the first pump and after 2 more hours the third pump was stopped. (a) Let's calculate when the tank was totally filled up. (b) Let's calculate how much of the tank the second pump filled up.
